The built-in pellet fire

stûv THE
ESSENTIAL
FIRE

Enjoy the pleasure of a built-in stove
with the benefits of pellet fuel.

The sP20-in sculpts the flame and blends into the architecture

A pellet fire can be jumpy, erratic. Not this one. The flower burner, patented by Stüv, shapes an ample, calm and colourful flame, close to that of a wood fire.

Your eye follows the flame without obstacle, wherever you are in the room, thanks to the “continuous line®” of the combustion chamber that extends into the door.

The sP20-in fits in perfectly. The flue is concealed, no grille is visible, the loading hatch and the ash pan remain out of sight. Only the fire remains.

Built into the wall, the fire frees the floor and lightens the living room. The aesthetic is clean, the space breathes.

SILENCE

SO WE CAN HEAR OURSELVES

THINK

The sP20-in works by natural convection. No blower, no fan noise, no audible pellet drop. The heat rises, the air circulates, the room stays calm.

You read, you talk, you watch a film. The fire accompanies your moments of life, it does not impose itself.

Your fire takes care of you

Programme your sP20-in so the house is warm when you come home. The Stûv Pellets app lets you adjust the temperature remotely, wherever you are.

The loading hatch is integrated into the front, so you pour in the pellets in complete safety. The hopper holds 18 kg.

De-ashing is automated and the ash pan is generous. You enjoy the fire for longer.

As an option, the ductable convection kit spreads the heat beyond the living room. A tempered bedroom, a pleasant hallway, a warmed upper floor: the sP20-in heats where you live.

The Pellet Twin Set, an elegant and practical accessory

No more handling heavy bags or cluttering your space. Storing, carrying and pouring your pellets becomes a simple, comfortable and aesthetic gesture. An essential to enhance the Stûv universe, where every detail counts.

Two integrations, one fire

The sP20-in can be integrated in two ways, depending on your interior and the height of your opening.

In the standard version, the finishing uprights frame the fire up to the lintel. The integration remains discreet, the fire fits into the existing masonry.

sP20-in standard

In the version with extension, the uprights continue up to the ceiling. This verticality asserts the presence of the fire in the room. It is a Stûv signature.

In both cases, the finishing uprights ensure a clean junction between the fire and the wall.

sP20-in with extension

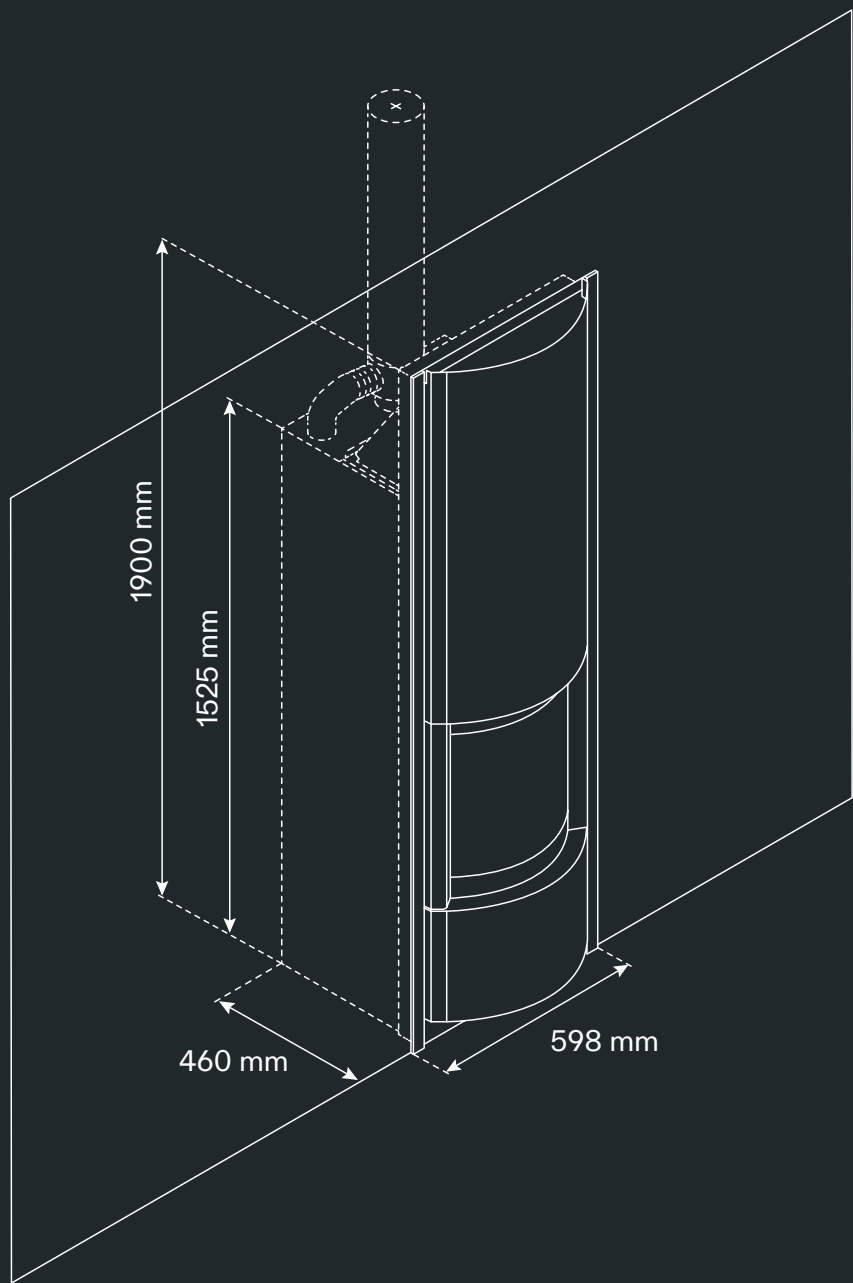

Designed to be maintained

The pre-installation casing is fitted at the structural stage, and the fire takes its place at the finishing stage. Installation is carried out by a Stûv-approved professional, in compliance with the standards in force, including the electrical safety of your appliance.

The fire is removable: your technician reaches it quickly, without touching the finishes. Annual servicing and chimney sweeping are done cleanly, in a limited time. You get on with your day.

Dimensions

Performance

Energy efficiency class	A+
Energy efficiency index	130
Nominal heat output	7,8 kW
Output range	4,3 – 7,8 kW
Nominal efficiency	91,8 %
Seasonal efficiency	94,2 %
Particulate emissions	12 mg/Nm ³
CO emissions	0,008 % / 31 mg/Nm ³
NO _x emissions	114 mg/Nm ³
OGC emissions	< 1 mg/Nm ³
Pellet consumption	0,93 – 1,74 kg/h
